

Targeted Tissue Removal Using Cavity SpineWand®

8G Cavity SpineWand Tip

Now you can address a significant condition in your patients undergoing interventional spine procedures

- Compatible with Parallax percutaneous access cannulae needles including threaded cannula lines.
- Coblation® plasma tissue dissociation creates a precise space in a malignant lesion.
- Fluoroscopic visualization allows for targeted tissue removal.
- Can be followed by other complimentary procedures such as vertebroplasty.

FDA cleared for creating a cavity in a malignant lesion

A targeted treatment option for malignant lesions

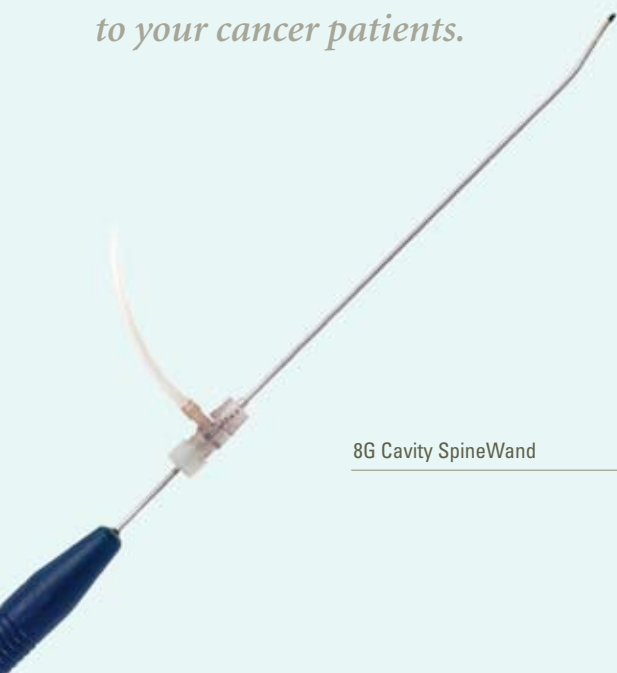

Cavity SpineWand

for focused tissue ablation

Cement channels in vertebral body, after tumor ablation and Vertebroplasty

Coblation is a proven technology for removing soft tissue. It has been used in millions of procedures worldwide and is available to your cancer patients.

8G Cavity SpineWand

A clinical need

Soft tissue abnormalities are a significant co-morbidity in patients undergoing minimally invasive procedures. Clinical evidence demonstrates that they are a confounding factor in procedures that should otherwise be straightforward.

A unique treatment option

Until now, soft tissue lesions in the spine have not been fully addressed by appropriate medical technology. Recent advances have allowed for necrosis of the soft tissues, but do not remove the tissue, and leave dead tissue behind within the spine.

Despite these developments, tissue necrosis has proved an insufficient remedy. Merely killing tissue may offer some benefit to the patient, but does not overcome the confounding effect of the tissue on subsequent procedures.

Tissue removal is the answer

Only by removing tissue can limitations of the procedure be overcome. With partial or complete tissue removal, enhanced treatment may be possible.

The Cavity SpineWand is the advanced treatment that patients have been waiting for.

Available in two sizes:

- 8G (*featuring a curved tip*)
- 11G
